Malicious Software Detection Report

マルウェア検出報告

February 22, 2018 Editor: Kitani

Most malicious software (malware) in January 2018 was a variant of "Win32/Slimware.A". This is a potentially unwanted application, which has also been categorized as adware-type program. The program called "SlimCleaner" attempts to install an additional bundled software modify your HP or your search provider, and perform other actions that you might not have intended. If you installed the Center's security software, you don't need to worry because the activity was blocked.

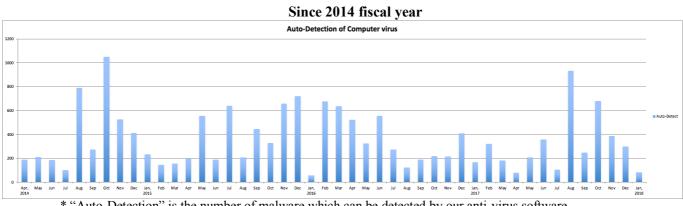

However, At least, PLEASE check the following prevention measures.

1. Create "Autorun.inf" folder on the top of your removable media.

A lot of malware tries to overwrite "Autorun.inf" file on the top of a removable media because Windows OS automatically carries out a program by loading "Autorun.inf" setting when the media inserts to a PC. b Therefore, the malware is lurked into a hidden area and it tries to act by loading "Autorun.inf" file. A simple malware is failure the overwriting of "Autorun.inf" file if "Autorun.inf" folder exists. This is a small-scale security prevention measure, but please cooperate for reducing the infection to removable medias.

2. Update of the computer security
