

# Malicious Software Detection Report

## マルウェア検出報告

September 25, 2018 Editor: Kitani

Most malicious software (malware) for 3 months (06-08/2018) was a variant of “JS/Adware.Revizer.E”. This aims to make a user pay money using a fake clever advertisement. When you access a web site, a critical security incident message may be displayed your web browser. Please don’t believe an message. Firstly, you should contact the information processing office. The Center’s security software had been blocking it but please check your security software (latest virus definition, not too old software) in your PC if you have a private PC which needs to protect a malware by yourself.

However, At least, **PLEASE check the following prevention measures.**

### 1. Create "Autorun.inf" folder on the top of your removable media.

A lot of malware tries to overwrite “Autorun.inf” file on the top of a removable media because Windows OS automatically carries out a program by loading “Autorun.inf” setting when the media inserts to a PC. b Therefore, the malware is lurked into a hidden area and it tries to act by loading “Autorun.inf” file. **A simple malware is failure the overwriting of “Autorun.inf” file if “Autorun.inf” folder exists. This is a small-scale security prevention measure, but please cooperate for reducing the infection to removable medias.**

### 2. Update of the computer security
